Nandrolone decanoate (Deca)

Dosage

This drug refers to anabolic agents. For men, the recommended dose is 200 mg at a time, calculated for 7-28 days. For women, the dose is halved – up to 100 mg.

Side effects

When using anabolic steroids, serious deviations in the work of the body were not noticed. However, if the dosage prescribed by sports doctors is exceeded, an increase in blood pressure is possible. If the athlete does not have good blood clotting, then bleeding from the nose and gums, migraines, acne and more may appear.

A significant excess of the drug in the blood can lead to malfunction of the testes. Testosterone production decreases and is accompanied by the release of gonadotropins. Also, a prohibitively high concentration of nandrolone can cause erectile dysfunction.

Reception effects

- Increased muscle endurance.
- A set of muscle mass (up to 8 kg per course).
- Removes pain in ligaments and joints.
- Increases immunity.
- Strengthens ligaments and bone tissue.
